

PROLINE EARTHING SHIM

- + Creates electrical bonding between module frame and rail
- + WEEB-style design for reliable grounding performance
- + Stainless steel construction for long-term durability

EFFECTIVE MODULE-TO-RAIL GROUNDING

The Schletter ProLine Earthing Shim is designed to provide a reliable electrical connection between the solar module frame and the mounting rail, ensuring effective system grounding throughout the installation. Installed beneath the module clamp, the stainless steel WEEB-style shim penetrates the anodised surfaces of both the module frame and rail when tightened, creating a secure electrical bond without additional grounding components. Specifically engineered for use with Schletter ProLine mounting systems, the earthing shim helps simplify installation while supporting compliance with grounding requirements. Manufactured from corrosion-resistant stainless steel, it delivers dependable long-term performance in demanding outdoor environments.
